

J48 DECISION TREE

After the classifier ran I right-clicked the result in the Result list and selected Visualize tree. The tree window displayed the entire J48 Decision Tree constructed by WEKA using the training data. The root node showed that Attendance was the most significant splitting

attribute.

Figure 4: WEKA J48 Decision Tree. Root node splits on Attendance at threshold 0.575. Low performers are those students with low attendance. High attendance students are then divided by Hours_Studied at 0.372, creating medium and high students. There are 1,779 H

I set minNumObj to 2 and used a confidenceFactor of 0.25 which gave good pruning and hence a clean and readable tree. There is a direct confirmation of the root split Attendance at 0.575 from the InfoGain ranking, which shows Attendance with a score of 0.3557, more than double any other attribute.
